# Accessibility checklist for Designers

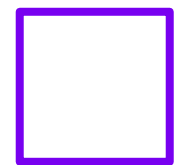

Design a clear and logical user interface for your website.

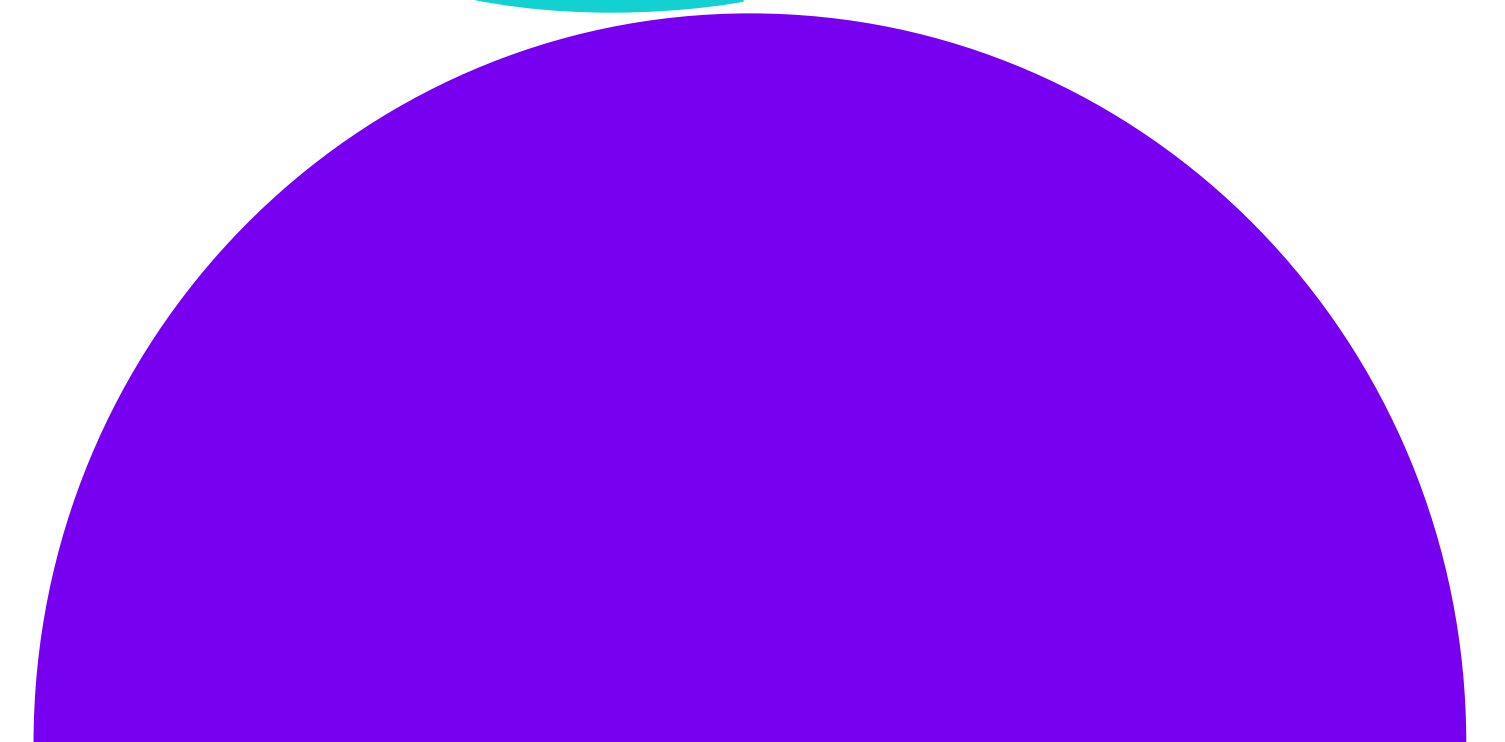

Aim to design a site navigation that is easy to use and understand. Avoid complex menu structures.

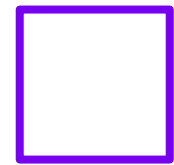

Check the contrast of all the colour combinations you use.

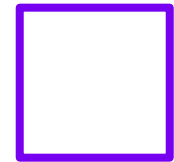

Choose a font that is as legible as possible.

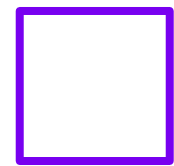

# Accessibility checklist for Designers

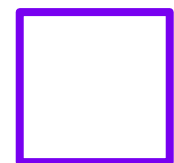

Design both visible hover and focus styles for all interactive elements.

Remember that the page must be zoomable and viewable on different devices.

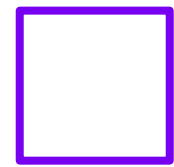

Make sure that the link effects are unique in the layout design, this will also guide the content creator to produce the right kind of content.

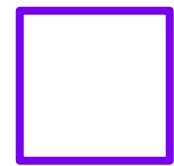

Design link styles that are distinguishable from the rest of the page. Underlining in the link default state is a clear link indicator.

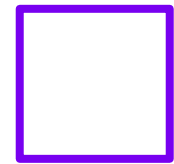

# Accessibility checklist for Designers

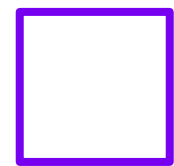

Don't convey information through colour alone.

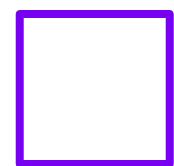

Avoid designing video or audio elements that play automatically.

Make sure the user can pause the videos and sounds on the page.

Avoid designing elements that may cause nausea, such as movement behind text or a parallax effect.

Add names (preferably visible labels) to all form fields. Don't misuse the placeholder attribute as a name substitute.
